

1. T must include operator>(const T&)
T must include copy constructor T(const T& other)
T must have (in case there is non-default) default destructor
2. They would have the access to change the data in the sortedList and destroy the whole point of the sortedlist (that it is sorted)

3. Template <class T>

```
Class mod {  
    T mod_number ;  
Public:  
    Op(T number) : op_number(number) {}  
    Bool operator()(T number) const{  
        Return (number % mod_number) == 0 ;  
    }  
};
```

```
SortedList<int> filterList( const SortedList<int> & list, mod<int> number){  
    Return filter(mod<int>(number));  
}
```
